

# **LASER TREATMENT: MOST EFFECTIVE AND PAINLESS TREATMENT FOR VEINS DISEASES**

Veins diseases are increasing day by day. Women get more affected by these diseases as compared to men. And the reason behind this difference is the responsibilities. Women have more responsibilities as compared to men which lead to seeking treatment. It is very bad news because most of the people simply ignore these diseases which can cause more severe complications. You must visit a [vein center](#) at an early stage to avoid these severe complications.

The most common veins diseases are varicose veins and spider veins disease. These are mostly cosmetic issues. Spider veins are normal, but varicose veins are more severe. Varicose veins can lead to severe vein diseases that may be cured by some of the **American vein centers**. It can also lead to various serious health issues like diabetes and heart diseases.

Luckily, treatments for varicose veins are available at the **vein care** center. The selection among these treatment methods depends upon the severity of the disease. However, the most common and most effective treatment method is laser ablation therapy. Laser ablation therapy is performed in the various **laser and vein center**.

## **Symptoms of Veins Diseases**

If you feel any of these symptoms in your body then immediately visit a **vein laser clinic** for the best possible treatment.

- Heaviness and pain in legs.
- Burning sensations, throbbing, swelling, and cramping in the legs.
- Not able to sit or stand for a long period of time.
- Itching around the veins.

- Skin ulcers near to your ankles and lower part of the legs.

## Laser Treatment

The [center for vein restoration](#) will guide you with the vein's issues and possible treatments. However, laser treatment is the best option for the treatment of veins diseases.

In the procedure of laser treatment, the affected vein is given local anesthesia. Then a slender laser fiber will be inserted inside your affected vein using tiny incisions. This laser fiber will deliver laser energy in a short pulse.

These short pulses will seal the vein and block the flow of blood. And the blood will be redirected to the other healthier veins. After completion of the procedure, the fiber optic will be removed.

It is a minimal discomforting and painless procedure. It doesn't require any recovery time. You can immediately resume your work after the completion of the treatment procedure. But you need to take certain precautions as advised by your vein specialist.

You need to wear compression stockings in your leg for at least a week or two. You can start to walk soon after your treatment procedure and resume normal activities. However, gyms and other strenuous exercises should be avoided for some days.
