

## A new world with less clothes

In recent years the sale of clothing increase and it damage the environment.

The sale of non-biodegradable clothing is too important and too much of clothing are produce.

If too much of textil are throw it releasing harmful gases. For example, 37kg of clothing was throw in to 200 years and releasing a lot of harmful gases.

Secondly, if we produce 1 shirt plus 1 jean we consume 20,000 liters of water and it's also to much.

However, we know that ice cap is melting but everyone continues to use as much water for clothes.

We have different solutions :

The first is, if we produce less clothing, less harmful gases will be produce.

The second is if we sell our clothes that we no longer wear, less clothes will be throw in the nature and will have a second life.

The last solution is, if we donate our clothes for the FabBRICK association, we can give them a new utility.

To change things, we propose to open an online kitty to help finance new entrepreneurs who can to open a secondhand clothe store. We also propose to gave more visibility to the FabBricks association by making poster !
