

The bees are going extinct

Pb : Why bees are so important ?

Intro : We're going to make an awareness campaign to protect bees from going extinct

To begin, the causes of the extinction of bees are : the climate change, the global warming, the parasites, habitat loss, cell phones, pesticides, hornets attacks, etc.

The risks may be : first of all, the plants couldn't grow naturally because they need pollen to get planted naturally if bees disappear. Man will have to plant all by himself. If bees goes extinct, 80 % of plants will disappear and about 50 % of fruits will disappear as wel. So all animals will starve because : no herbivorous animals, no food for carnivores ones and if both of them disappear, humans will never eat animal meat anymore.

- Bees will die and us with them

To help saving them, we can set up some short-term objectives : - plant bushes, flowers

And we can set up long-term objectives as well : -raise bees in your garden (have a hive in your garden)

To help bees, we can also try to consume more honey, have a water barrel, for bees to not have to make a journey to death to search for a water spot, in your garden because the global warming is droughting lakes and rivers.

To help bees, we decided to create a race to raise money to help paying people to create water stations for bees to drink and stay hydrated. The race is going to take place at Courcelles-les-Lens (COSEC) this Sunday 6 of February from 11 a.m to 7 p.m. The entry will be free but the more you make lapses of the field, the more you raise money to help bees.
