

The extinction of the polar bears

We want to raise people awareness about the extinction of the polar bears.

There are about 25 000 polar bears in the Arctic at the moment and they could become nearly extinct by the end of the century.

The ice is melting because of Global warming. Indeed, the ice is shrinking by 13,4% every 10 years. Consequently this reduce their hunting territory and they are having trouble to feed themselves.

If the polar bears were to go to extinct, the population of the whales, seals and birds would increase and get out of control because there wouldn't be predators to decrease the population.

You have to reduce your carbon emissions because it can help reduce pollution which affect the bears's habitats.

You should also live a more eco-friendly life, for exemple you should use your car less and recycle more, you should also turn off electric devices when you are not using them.

What about creating protected spaces to preserve polar bears and its habitat ?

The WWF has a program where you can adopt a bear for 55\$, when you participate to this project you get a kit with a plush doll and an adoption certificate. The money goes to help the polar bears.

We decided to organize a concert where the money goes to an association for the protection of the polar bears. We are going to invite singers and musicians for them to perform and we will make people pay the entrance. We will also make a stand where we are going to sell drinks and snacks so we can gather more money.
